During the last decade 60–130 new sites have been discovered annually. The average count is 80 new sites per year and 2008 was no exception. The table in this article contains 76 new sites, including 57 settlement sites, 5 burial places, remains of smithy, a hoard site, a refuge site, etc. New sites were discovered in most of the counties of Estonia (Fig. 1). Large-scale field surveys were carried out in the Counties of Põlva (22 new sites), Tartu (15 new sites) and Pärnu (11 new sites). The most productive discoverer was

Jn 1. 2008. aastal avastatud muistised.

Drawing / Joonis: Marge Konsa

Andres Vindi, a technician in the Laboratory of Archaeology at the University of Tartu. More than half of the new sites were discovered by him.

Several surveys were carried out by Ester Oras, a graduate student in the University of Tartu in the scope of her Master's thesis (2009). The purpose of these was to investigate the contexts of Middle Iron Age hoards. In addition to locating the known hoard sites new sites were also looked for. As a result of this survey work 23 new sites were discovered, mainly from the Counties of Viru, Järva and Tartu. Especially noteworthy are the Kalmaküla (nos. 7 and 8) rich Neolithic settlement sites on the north-west coast of Lake Peipsi. Until now, only a few Mesolithic bone finds were known from there (Jaanits & Moora 2008, 397, fig. 2).

Our understanding of the settlement patterns around Lake Peipsi was also improved in some parts of Setumaa. Arvis Kiristaja carried out several expeditions in the scope of the project 'The Formation and Development of Settlement in Setumaa from Stone Age to Iron Age', which was a part of the national Setumaa program of the Ministry of Culture. In addition to numerous settlement sites two new Talka-type barrow groups were discovered in Värska. One of these is located near the crossroads of Värska–Podmotsa and Määsovitsa–Sagora roads (no. 32), where 4 large and 6 smaller barrow-like formations were discovered. These are located on an area of approximately 100 × 100 m surrounded by a rampart. The other group is located 1 km south of the former Kotelnika village (no. 26), where about ten mounds form two lines parallel to the road (Kiristaja 2008).

Renaldo Veeber from the Saatse Museum helped to locate several folklore-related sites in Lobotka. According to folklore a sacred place was located on Jumalamägi (God Hill) in the northern part of Kolossova village (no. 25). The two-part Kuningamägi (King Hill – 47.3 m a.s.l.), which is covered by a pine forest and located in the southern part of Podelikusuu village is considered to be a former refuge (no. 27), where people hid even as late as during World War II.

Mari Lõhmus (MA), initiated an expedition to Tori, in the County of Pärnu. This resulted in new knowledge about a Stone Age settlement on the banks of the Pärnu and Navesti Rivers. Of the newly discovered sites the most prominent one is the Mesolithic settlement site with rich finds in Päästale on the north bank of the Pärnu River (no. 47). The list of 12th – 14th cc. settlements in Pärnu County was supplemented thanks to the work of Mati Mandel (AM). The only hoard handed over to a museum in 2008 was found in Pärnu County by Rein Roodus (see Kiudsoo, this volume).

Smaller surveys were carried out in the Counties of Harju, Rapla and Võru. Aivar Kriiska led an expedition which discovered a Stone Age settlement and two Iron Age settlements on the bank of the Jägala River (nos. 1–3, Kriiska *et al.*, this volume). The National Heritage Board commissioned Aarne Kivistik and Mauri Kiudsoo to check the sites discovered by Kivistik during his years of work as a trustee of the National Heritage Board. The coordinates of these sites were cross-checked with the National Register of Monuments. As a result of this work new sites were also discovered. Toomja remains of smithy (no. 53) in Rapla County is an example.

In south Estonia archaeological survey of lakes and their surroundings was continued. This year attention was focused on Plaani Külajärv (no. 74) in the Haanja Uplands. Previously, an Early Iron Age settlement site, a Late Iron Age barrow and a Middle Age rural cemetery have been investigated on the south-eastern bank of the lake (Peets 1988). In 2008 Marge Konsa discovered a cultural layer of a settlement site on the eastern bank of the lake, within the borders of the Soka farmstead. The potsherds found there were identified by Andres Tvaauri as group 2 of plain wheel-thrown pottery from north-west Russia and dated to the 11th century (pers. comm.).

A joint project of the Islands program of the Ministry of Culture and the Centre of Excellence in Cultural Theory was started in 2008. It is titled 'The Archaeological Heritage of the Marine Culture of the Islands' and carried out by the University of Tartu, the Tallinn University and the National Heritage Board. Fieldwork was carried out on Vormsi and Ruhnu islands. On Ruhnu (no. 54), Mirja Ots discovered a Late Neolithic settlement site. The site is situated by the road leading from the Ruhnu lighthouse to the former border guard outpost in Valgi. The site is badly damaged by a quarry. The preserved part of the site measures about 80 × 40 m, containing Corded Ware and flint of foreign origin. Charcoal from a layer containing ceramics in one of the test-pits was dated. The ¹⁴C-analysis gave the result 4130±40BP (cal. 95.4% 2880–2580 BC).¹

All the sites described above were discovered in the course of planned studies as a result of fieldwalking, sampling and surveying. In addition some chance discoveries were also made, during salvage archaeology and construction work. During the excavations in connection with the reconstruction

¹ Poz-30595.

of Vabaduse Square in Tallinn (no. 5) a Neolithic settlement site was discovered. The layer containing Comb and Corded Ware lay at 15–16.5 m above today's sea level, dating from approximately 3200–2800 BC (Kadakas *et al.* 2009). On the island Saaremaa near Salme village (no. 55) the first prehistoric ship in Estonia was discovered (see Konsa *et al.*, this volume). The existence of a rural cemetery in Mustahamba village (no. 73) in Võru County was discovered in connection with motorsports activities – the motorcycle club Mad Devil held a hill climbing contest on Kalmõmäe (Grave Hill). Prior to the contest, some of the soil was peeled and heaped to form the racetrack. After the contest the bones of two adults and two children, and one iron knife with a bone handle were found (Veldi 2008). Unfortunately the land owner has not understood the historical importance of the site and has disputed placing the site under heritage protection.

Items found by metal detectorists that reached museums in 2008 included finds from two archaeological sites. Urmas Kuusiku found a collection of Late Iron Age bronze and silver jewellery (Fig. 2) on a field near the Rutikvere manor (no. 17). The site was later inspected by archaeologists who discovered ceramic fragments and a settlement layer measuring 200 × 100 m (Haak & Veldi 2008).

Priit Kumel used a metal detector near Keila and found a bronze axe (no. 4; Kadakas, 2009). The find was discovered from a field, 200 m north of the economic center of Tutermaa village, 5–10 cm deep in the ground. The axe, with the length of 11 cm, is of the narrow-bladed, high-flanged type (Fig. 3). 6 similar items have been found previously in Estonia, the latest was found in 2003 from the Meriküla beach near Aseri (Tamla 2004, 18). These belong to the earliest metal items in Estonia, dating from period IB of Montelius (16th century BC) (Lang 2007, 39).

ABOUT THE TABLE

A site is reported in this table only if relevant finds or information has reached the archaeological collections. The sites are sorted according to county of location. The name of the site is usually the village. If the name of the site is different from the name of the village, then an explanation is supplied in the description column of the table. Andres Tvaauri helped with the dating of new finds from Iron Age and Historic Period stored in the archaeological collections of the University of Tartu. Additional information about the sites listed in the table can be obtained from the archaeology archives of the Universities of Tartu and Tallinn.

Acknowledgements: this study was supported by the European Union through the European Regional Development Fund (Center of Excellence CECT).

2008. AASTAL TOIMUNUD MAASTIKUINSPEKTSIOONID JA AVASTATUD MUISTISED

Käesoleva artikli juurde kuuluvas tabelis on 76 uut muistist (jn 1), nende hulgas on 57 asulakohta, 5 matusepaika, sepikojaase, aarde leiukoht, pelgupaik jt. Ulatuslikumaid maaстikuinspektsioone tehti Põlvamaale (22 uut muistist), Tartu- (15) ja Pärnumaale (11). Kõige edukam muististe otsija oli TÜ arheoloogia kabinet tehnik Andres Vindi, kes leidis üle poole 2008. aasta avastatud muististest.

Ester Orase korraldatud välitööde tulemusena leiti 23 uut muistist peamiselt Viru-, Järva- ja Tartumaalt. Eriti tähelepanuvääärne on rikkaliku neoliitilise leiumaterjaliga Kalmküla asulat avastamine Peipsilooderannikul. Arvis Kiristaja tegi mitmeid inspektsioone Setumaal. Saatse muuseumi eestvedajale Renaldo Veerberile abiga lokaliseeriti mitmeid pärismuspaiku Lobotka vallas. Mari Lõhmuse initsiativil tehti uurimisretk Tori valda Pärnumaale, kus avastati mitmeid uusi mesoliitilisi asulaid Pärnu ja Navesti jõe kallastel. Pärnumaa keskaegsete asulakohtade nimekiri täienes tänu Mati Mandli eestvedamisel toimunud inspektsioonidele. Pärnumaalt avastati ka 2008. a ainus muuseumi jõudnud aardeleid, mille leidmisau kuulub Rein Roodusele. Aivar Kriiska juhatatud Jägala ekspeditsiooni käigus leiti uusi asulakohti Jägala jõe kaldapealsel. Raplamaal Toomja külas tuvastasid Aarne Kivistik ja Mauri Kiudsoo muistse sepikoja jäänused. Lõuna-Eestis jätkati järvede ja nende lähiümbruse arheoloogilist inspekteerimist, mille käigus avastas Marge Konsa hilisrauaaegse asula Plaani Külajärve idakaldalt. Projekti "Saarte arheoloogiline merekultuuripärand"

raames tehti välitöid Vormsi ja Ruhnu saarel, kus Mirja Ots avastas Valgi asulakoha, mis ^{14}C -dateeringu järgi kuulub hilisneoliitikumi (4130 ± 40 radiosüsinkuaastat e. 2880–2580 eKr). Neoliitiline asulakohat avastati ka Tallinnas Vabaduse väljakul ümberehitusega seotud väljakaevamistel. Saaremaal Salme asula lähedal leiti tee-ehituse käigus Eesti esimene muinaslaev. Võrumaal Mustahamba küla Kalmõmäl tuvastati külakalmistu olemasolu, kui mäel korraldatud motovõistluste tulemusena tekinud sügavatest rööbastest tulid nähtavale inimluud. Kahjuks ei ole maaomanik mõistnud muistise ajaloolist ja kultuurilist väärtust, sest vaidlustas kalmistu muinsuskaitse alla võtmise.

Metallidetektoristide kogutud esemetest jõudsid 2008. aastal muuseumi leitud kahest kohast. Rutikvere mõisa lähedalt pöllult leidis Urmas Kuusiku hilisrauaaegseid pronks- ja hõbeehteid (jn 2). Keila lähedalt leidis Priit Kumel pronksist rantkirve (jn 3), mis päri neeb vanemast pronksiajast 16. saj eKr.

Artiklike lisatud tabelis leiavad kajastamist ainult need muistised ja leiukohad, mille kohta on leitud või leiukoha andmed edastatud riiklikeesse arheoloogiakogudesse ja arhiivi. Muistise nimes kajastub enamasti küla nimi. Kui muistise ja küla nimes on erinevusi, siis tabeli asukoha kirjelduse lahtris on lisatud vastav täpsustus. TÜ fondi raua- ja ajaloolise aja uute muististe leiumaterjali aitas dateerida Andres Tvauri. Lisainfot tabelis toodud muististe kohta saab TÜ ja AI arheoloogia arhiivist.
