In 2008 altogether 141 permits for various kinds of archaeological fieldwork were issued by the National Heritage Board (MA) and the Cultural Heritage Department of Tallinn City Government (TKVA) (Table 1). The number of issued permits does not differ from the general statistics of previous years remarkably and quite the same tendencies as in 2007 are apparent.

First of all, the total number of research related excavations (Fig. 1: A) was less than $\frac{1}{10}$ of all the archaeological fieldwork in 2008. Similarly to 2007 (Kraut & Tamla 2008) the total of supervision work (Fig. 1: B) clearly dominated fieldwork forming half of the issued permits. Adding the total amount of rescue excavations (Fig. 1: C) and preliminary research (Fig. 1: D) it becomes obvious that the amount of rescue or supervision related fieldwork formed over 80% of all the archaeological fieldwork carried out in Estonia in 2008. And again the most numerous works were connected to supervision and rescue excavations in the areas of Estonian towns and cities (Tallinn, Tartu, Pärnu, Narva, Haapsalu), listed as heritage protection areas, where large scale earthwork had to be organized due to future development plans and installations of various cable and pipe lines. Some major landscape surveys (Fig. 1: E) were organized with special licences applied for beforehand. It is also worth mentioning that altogether 6 licences were issued for underwater archaeological research and preliminary investigations.

Research related excavations were carried out by academic institutions, but also some private companies organized scientific excavations (see below), different companies and enterprises clearly prevailed in rescue-related excavations. All archaeologists who have been issued an excavation permit have an obligation to present a report of their excavation work to the National Heritage Board, where the reports are archived and open to public for further interest and consultation. Failure to submit reports from previous excavations is considered at the permit issue process the following year.

RESEARCH RELATED EXCAVATIONS

The number of research related excavations in 2008 was 12 (Tab. 1: A). These were mainly carried out by the University of Tartu and Estonian

History Museum. If we regard some of the underwater wreck documentation work as research rather than field survey, then a private company Tuukritööde OÜ can be added to this list raising the number of research related work to 16. Research related excavations were mainly either connected to special academic grants or continued previously started work, though an example of Salevere Salumägi (Table 1: 22, 70) excavated by Helena Kaldre (TÜ) is at least partly a newly discovered site that turned out to have high scientific value.

Most of the research related excavations in 2008 – their main results and first interpretations – are represented in different articles in this volume and therefore no detailed information is provided here. It can be summarized that in general the excavations covered both the north and south part of Estonia, spreading also to western areas. The periods covered the time span from the Stone Age (Aivar Kriiska in Tõrvajõe (Table 1: 72) and Jägala Jõesuu hill fort (Table 1: 71)) to the modern period (underwater investigation in the Gulf of Finland by Tuukritööde OÜ (Table 1: 31–35, 45)), though most of the emphasis was given to Iron Age periods (Heiki Valk in south Estonian hill forts (Table 1: 64–66, 69), Mati Mandel in Uugla archaeological complex, (Table 1: 61–62) and Helena Kaldre in Salevere).

Special attention deserves to be paid to underwater research carried out by Kaido Peremees, Tuukritööde OÜ. Altogether four different shipwrecks in the Gulf of Finland were examined. These investigations were commissioned by the National Heritage Board in order to acquire more detailed information about our underwater heritage objects and their state of preservation. The following vessels were investigated with sonar and by divers: fregat 'Wachtmeister', liner 'Riksens Ständer', and the so-called Littegrund wreck and *Suure paadi augu laev* (Ship of the hole of a big boat)¹ wreck (Table 1: 32, 31, 45, 33 accordingly) (data from <http://register.muinas.ee>; nos. 22 262, 22 263, 27 764, 27 871). All of them have been discovered in the past decades and they are mostly dated to the modern period. The so-called *Suure paadi augu laev* (Fig. 2) as the oldest (15th century) *in situ* find in Estonia (Veealune kultuuripärand Eestis 2008) was also filmed with ROV (pers. comm. Maili Roio (MA)), the studies resulted mostly in sonar pictures in different scales, but also some photographic documentation was rendered using specialist gadgetry. As in previous years the research was managed by the National Heritage Board and in the history of Estonian archaeology such precedents in the field of underwater archaeology where information (not only for documentation, but for future research also) is gained by specialized company in cooperation with different institutions are not scarce anymore. Still, considering that the total number of Estonian underwater heritage is under 40 (according to

statistics represented at <http://register.muinas.ee>), any underwater heritage research, especially larger scale, is of great value.

RESCUE EXCAVATIONS, SUPERVISION WORK AND PRELIMINARY INVESTIGATIONS

It is interesting to notice that Pärnu with its 24 issued permits for rescue excavations and supervision work supersedes even Tallinn and Tartu (21 and 14 permits, respectively), leaving behind also Narva, Viljandi, Haapsalu and Paide with their less than 10 issued permits (Fig. 1: B, C).

However, when comparing the fieldwork area and the volume of work in 2008, the archaeological excavations in Tallinn clearly exceed all the other towns in the mentioned criteria. No doubt, the biggest challenge of the last years was the excavation work related to the reorganizing of the main square of our capital (Table 1: 41, 46, 82) (Fig. 3). The work started in April 2008 and continued throughout the year until the middle of March 2009. The archaeological investigation in Vabaduse Square (*Vabaduse väljak*) and its closest surroundings consisted of two separate projects, which altogether covered the total area of 10 000 m². Commissioned

by the Estonian Ministry of Defence, in April – June 2008 archaeologists from OÜ AguEMS (Guido Toos, Villu Kadakas) investigated the early modern earthen fortification – Ingrian Bastion – in the western part of the square. The work was conditioned because a memorial for Estonian War of Independence (1918–1920) on the area of the former bastion was going to be built. The new monument created high public interest towards the work of archaeologists. The opponents to the monument referred to some recently discovered exceptional building details (Fig. 4) as an argument to cancel the project. However, the attempt was not successful. In order to tackle the challenges connected with the archaeological excavations of the square an Expert Council for Tallinn Archaeological Heritage was summoned. The council concluded that archaeologists were put under inequitable pressure due to the inaccurate development of the project

Fig. 4. Walls discovered after the removal of the left flanc earthen fortification of Ingrian Bastion at the excavations at Vabaduse Square, Tallinn.

In 4. Tallinnas Vabaduse väljakul Ingeri bastioni vasaku flangi mullast kuhjatud laskevalli eemaldamisel avastatud tugimüürid.

Photo / Foto: Erki Russow

and the council did not regard it necessary to inhibit the erection of the monument. Archaeological work at the square and in its surroundings continued at the end of May first with relocating the communication trenches that remained in the way of the planned underground car park. Archaeological supervision of the new trenches was carried out by OÜ Tael (Vladimir Sokolovski). In the area of their responsibility the most important scientific information was connected to the early modern period St. Barbara cemetery at the south-western part of the square, but also the discovery of the foundation of a medieval zwinger in the north-western part of the square.

The archaeological research just underneath the main area of the square started in June 2008 (OÜ AguEMS, Guido Toos, Villu Kadakas, Ragnar Nurk, Garel Püüa), the first thing was to document the early modern period fortifications. The mentioned fortifications (Fig. 3, below) have been previously well documented both archaeologically and in written sources, but the research at the southern part of the square brought a great turn into the planned fieldwork program. At the beginning of July it became clear that besides medieval and modern period strata, also some well preserved marks on a Stone Age settlement existed (Kadakas 2009; Kadakas et al. 2009). This conditioned a much longer period of excavation

than initially planned and the fieldwork that was meant to conclude in 2008, continued until March 2009. Therefore a more thorough overview of the work is worth waiting for in the next year's volume.

Besides the above introduced large-scale excavations in Tallinn Vabaduse Square, the rescue excavations on a ship burial in Salme (Saaremaa) (Table 1: 114, 118) were also often reflected in the media and attracted public attention. These excavations were carried out by Jüri Peets (AI) and Külli Rikas (SM), and continued as well as concluded by Marge Konsa (TÜ). The unusual and in a way unexpected find, which the media followed with great interest, challenged researchers to use interdisciplinary studies in order to obtain maximum information about this wonderful discovery. Despite shortage of time, the rescue work in Salme developed into a research with its methods and committed team members, and the more detailed results are yet to be expected. This volume introduces the very first overview, although the research continues and new information both about the specific find and the possible burial ground in Salme are probably yet to come and amaze us in the future. Still, Salme might be regarded as a lesson for Estonian archaeology: not only for its scientific value, but also for its example process in making quick decisions, followed by actions, for its team cooperation, and also reminding us about the extreme informative value encoded in every archaeological object. That is why every fieldwork object deserves special respect and attention, because we can never know when something rare and unique might come to light.

The Salme project also stands out for the public interest towards the site and fieldworks. The team managed to provide up-to-date information about the excavation results, using the benefit of contemporary IT-communication methods, i.e. holding an online blog. The blog site (salmepaat.blogspot.com) has so far over 2000 visitors and more than 5000 page views (the count was started in November 2008, pers. comm. Marge Konsa). The positive feedback both from archaeologists and the general public proves distinctly the need for such information exchange (at least in the case of longer projects), which is quite wide spread in some parts of western Europe (see for example <http://blogg.sydsvenskan.se/uppakra/> about Uppåkra project in southern Sweden).

In Tartu, besides the archaeological fieldwork in the Cathedral ruins (Table 1: 50) (about which Martin Malve and Heiki Valk (TÜ) give an overview in this volume) the work carried out by Rünno Vissak (MTÜ AEG) from May to September 2008 at the corner of Ülikooli and Vanemuise Streets (Table 1: 25, 76) where altogether an area of 600 m² was opened (Vissak 2008; 2009) (Fig. 5), found some media interest, too (Saar 2008a–b). The preliminary research with ground-penetrating radar (Vissak 2008) and rescue excavations became necessary due to the plan of erecting a new building in the area. According to the previously known archaeological results in the closest surroundings of the plot and information gathered

tänavate nurgal.*

Photo / Foto: Eero Heinloo

during the preliminary research, hints about brick production there were expected to be found (Vissak 2008, 8). At the first phase the ruins of Jürgens department store and its porcelain shop were discovered. The store building had been destroyed in the Second World War. Two late modern stone pavements were discovered and though it was expected to unearth some medieval clay mining pits in the course of the excavations in deeper strata, no such constructions were discovered (Vissak 2009). It was also regarded probable to find some hints on medieval brick making, however, no clear marks about the brick production stoves in the area were discovered. Expectedly, also some medieval as well as Iron Age finds (including some human bones) were noticed, though the later earthworks had thoroughly mixed these layers and they were not in their primary location any more (Vissak 2009).

Larger-scale supervision and rescue excavation work took place in summer 2008 in Viljandi, Arkaadia tee (Table 1: 63, 92, 101) (Piirits 2008). These were commissioned by OÜ TAVT and Viljandi City Council and conducted by Peeter Piirits (MTÜ AEG). Most of the work was connected to earth works in the vicinity of Viljandi town wall and moat in order to replace the communications (install some pipelines and new pavement) in the surroundings. One aim of the work was to expose a part of the town wall to the public. A part of the outer side of the wall was therefore cleaned out and the ground level was lowered up to its 13th century constructions. Altogether 300 m of up to 2.6 m deep trenches were excavated. According to the submitted report most of them contained only later infillings of the moat. Still, in the inner side of the town wall it was possible to reach the medieval cultural layer just above the natural ground. Though the material of the excavations is considered to be of later historical periods or scarce, a crossbow bolt as one medieval find is worth mentioning here.

As mentioned above, a number of various excavations took place in Pärnu. The major projects that came to an end in 2008 will be introduced in this volume. The article by Rivo Bernotas, Aivar Kriiska (both OÜ Arheograator) and Aldur Vunk (FäMu) is one of the good examples of how the results of previous years are summarized into first stage interpretation and material exposition. Unfortunately this practice is not so common among archaeologists working in the difficult field of commercial archaeology. There are also cases in 2008, especially with larger projects, that the material tends to be so rich and documentation so broad, that the first results ready to be published in an article or even rapport have to be awaited for quite some time. As editors we kindly hope that the summaries of such extremely informative and important work will find their way to the pages of Archaeological Fieldwork in Estonia in years to come. Still, a much more serious problem occurs from time to time when excavation results are not even presented in a formal report, which is required by the National Heritage Board.

Supervision work, amounting to a total number of 72, is the dominant group of fieldwork. Supervision in all Estonia, mainly in towns, was accomplished on archaeological objects under national heritage protection, where earth work had to be undertaken. Mostly the work was connected with the installation of pipelines and cables. The archaeologists are to determine the character of a cultural layer. Such work is usually small scale, but the example at Saha (Table 1: 59, 126) (excavated by Gurly Vedru, and Kadri Nigulas from AI and TLM) and Paide (Table 1: 60) (excavated by Villu Kadakas from OÜ AguEMS) demonstrates how even such minor work can result in an interesting and important scientific value. Unfortunately not all the excavations deserving to be published are represented in this volume. For example, the large scale work in Narva settlement site and town fortifications (Table 1: 39, 53, 133–137, 140) carried out by Aleksandr Nikitjuk (OÜ Gradiens), is waiting to be presented in future.

Archaeological supervision in the buildings of Nunne (Table 1: 24, 111) and Pikk Street (Table 1: 47, 103) (carried out by OÜ Tael, Vladimir Sokolovski and OÜ AguEMS, Ragnar Nurk and Garel Püüa) and the archaeological survey by OÜ Tael and Vladimir Sokolovski in the cemetery of the oldest suburb of Tallinn – Kalamaja (*Vishermay*) (Table 1: 97) – are also worth mentioning. New important information was also gained through the preliminary research at Uus Street 12 (Table 1: 93) (OÜ AguEMS, Ragnar Nurk). There a part of the medieval moat was documented and well preserved foundations of a modern building were discovered. Larger-scale researches of the area are planned to begin in 2010. Unfortunately by September 2009 the archives of the National Heritage Board have not yet received any report about the archaeological fieldwork in Haapsalu in 2008 (larger supervision work took place at Kooli–Linda Streets, Jaani Street 6 and Toominga–Sireli Streets (Table 1: 49, 123, 138), all of them conducted by OÜ Tael, Vladimir Sokolovski).

LANDSCAPE SURVEYS AND STRAY FINDS

Altogether more than 300 stray finds were registered in the archaeology collections of Estonian museums, University of Tartu and Institute of History at Tallinn University. The oldest of them date from the Stone Age and the most recent ones from the modern period. Such a large number of stray finds is no doubt a kind of record in comparison with previous years. Still, unfortunately, not all cases give us reasons for rejoice. In many instances the specialists had to deal with people using metal detectors, who as so-called 'hobby archaeologists' hunting for remarkable finds in illegal manner gave us highly doubtful information about the finding circumstances. Therefore we can only discuss the stray finds which have been checked by specialists of the National Heritage Board or archaeologists themselves and have therefore evidently supported data about the finding contexts.

But first, 2008 was again rather fruitful regarding the number of newly discovered archaeological sites. More detailed information about these can be found in the last article of this volume, where Marge Konsa and Mirja Ots give a good overview of landscape surveys.² It is still worth mentioning that the tradition of organizing landscape surveys by experts who have obtained special permits is becoming increasingly more popular. That is especially valid for large scale projects, where surveys are conducted along with studies gathering specialized scientific information for later examination. An example is the project concentrating on maritime heritage (organized by Marge Konsa and Maili Roio), in the frames of which landscape surveys took place on Vormsi and Ruhnu (Table 1: 74, 90) islands in 2008.

However, positive cooperation with the public and their interest in stray finds is of great importance. Stray finds from archaeological landscape surveys are self-explanatory and logical, but archaeologists are not the only ones discovering interesting material from the past. In the

⁵ The authors have changed the form and information content of the article as compared to previous years and the editors are thankful for all their effort.

background of serious trouble with the above mentioned malevolent and what is more – illegal – detecting cases, which most definitely cannot be considered as a good-hearted hobby, the examples of responsible people handing over stray finds that are charged with invaluable archaeological information are heart-warming and worth to be highlighted. Fortunately the year 2008 gave some good examples of law-abiding persons concerned about the well-being of our national heritage. For instance, Urmas Kuusiku found some Late Iron Age and medieval jewellery fragments near Rutikvere manor and contacted Põltsamaa Museum who in turn addressed the matter to Tartu City Museum, who took the necessary steps to document the finds (pers. comm. Arvi Haak (TM)). Priit Kumel handed over a bronze axe (a palstave measuring $11 \times 5.3 \times 2.3$ cm) from the Early Bronze Age to Harjumaa Museum. The axe was discovered in Kütke village near Keila and its peculiarity is the highly worn-out blade part, which has not been the case with the 6 other axes of the same type previously known from Estonia. Marvin Tammhoid gave three bronze ornaments to the National Heritage Board. The ornaments were discovered in Järvamaa, at the surroundings of prehistorically densely

Fig. 7. Excavations of coin hoard at Napsu.

Jn 7. Mündiaarde väljakaevamised Napsus külas.

Photo / Foto: Mirja Ots

populated Kareda and Koigi villages. A bronze cross-bow fibula from the Migration Period and a decorative pin from the Viking Age are significant among these finds (Fig. 6). As both ornaments have burning marks, they probably might be interpreted as goods from cremation burials. A bronze war club that was found in 2008, but reached the archaeology collections and received some media interest in 2009, will be introduced in the next year's publication. And finally, Rein Roodus was lucky to find a real coin hoard from the beginning of the 18th century at the bank of Reiu River at Napsu village (Fig. 7) (Kann 2008). This hoard and newly discovered coin finds are introduced by Mauri Kiudsoo on the last pages of this volume.

Acknowledgements: the editors would like to thank all the organizations and colleagues involved in publishing this volume of Archaeological Fieldwork in Estonia. Also we would like to thank all the authors who found time to write about their fieldwork in 2008 and we are thankful for all of those kind people who agreed to share their photos for our introductory article. And last but not least, sincere gratitude belongs to our designer Epp

Ölekõrs for her hard work and compliance, to Helle Solnask for revising the English texts and especially to Ülle Tamla for her advice and assistance in editing, not to mention all her efforts in keeping the publication of Archaeological Fieldwork in Estonia developing and continuous over the last decade.

This research was supported by the European Union through the European Regional Development Fund (Center of Excellence CECT).

ARHEOOGILISED VÄLITÖÖD 2008. AASTAL

Muinsuskaitseamet ja Tallinna Kultuuriväärtuste Amet andsid 2008. aastal erinevateks arheoloogilistevälitöödeks välja 141 luba (tabel 1, jn 1:A–E). Neist $\frac{1}{10}$ moodustasid teaduskaevamised ja selgelt enamuse hõlmasid arheoloogilised järelevalved, päästekaevamised ning eeluuringud. Viimastest enamik toimus seoses erinevate kaevetöödega Eesti linnade muinsuskaitse aladel. On märkimisväärne, et ka ulatuslikumad maastikuinspektsioonid ning allveearheoloogilised uuringud kuuluvad 2008. a lubadega kaetud välitööde hulka. Pooled teaduskaevamistest toimusid akadeemiliste institutsioonide egiidi all, samas kui päästekaevamiste puhul moodustasid loa saanute enamuse erafirmad. Siinkohal on vajalik rõhutada, et kõigil loaomanikel on kohustus esitada Muinsuskaitseametile või Tallinna Kultuuriväärtuste Ametile aruanne toimunud välitöödest ning selle täitmist arvestatakse uute loataotluste läbivaatamisel.

Ühtekokku toimus 2008. aastal 12 teadustest madega seotud väljakaevamist, mida peamiselt korraldasid Tartu Ülikool ja Eesti Ajaloomuuseum. Suur osa vastavate välitööde tulemustest esitatakse käesoleva kogumiku järgnevatel lehekülgidel. Kokkuvõtvalt võib väita, et üldjoontes toimusid teadusuuringutega seotud välitööd nii Eesti põhjakui lõunapoolsetes piirkondades, ulatudes ka Lääne-Eestisse ja Saaremaale. Ajaskaalal hõlmasid uurivad objektid pikka perioodi alates kiviajast (Aivar Kriiska Tõrvajõel ja Jägala Jõesuu linnuse) uusajani (Tuukritööde OÜ allveearheoloogilised uurimused Soome lahes), ent selges enamuses olid erinevate rauaaja perioodidega seotud väljakaevamised (Heiki Valk Lõuna-Eesti linnamägedel, Mati Mandel Uugla arheoloogilisel kompleksil, Helena Kaldre Saleveres).

Eraldi väljatoomist väärivad Muinsuskaitseameti ja Tuukritööde OÜ korraldatud allveearheoloogilised dokumenteerimistööd Soome lahes. Sonaripilted ja allveefotosid tehti kokku neljast vrakist: fregatt "Wachtmeister", liinilaev "Riksens Ständer", Littegrundi vrakk ja Suure paadi augu laev (jn 2). Viimase juures toimus ka allveefilmimine.

Vaieldamatult oli viimaste aastate suurim väljakutse Eesti pealinna esindusväljaku ümberkujundamisega seotud päästekaevamine umbes 10 000 m² suurusel alal, kus alustati töödega 2008. aasta aprillis ja jätkati lõpule 2009. a märtsi keskpaigas (jn 3). 2008. a aprillist juunini uurisid OÜ AguEMS arheoloogid (Guido Toos, Villu Kadakas) Eesti Vabariigi Kaitseministeeriumi tellimusel väljaku lääne-küljel asunud uusaegset muldkindlustust. Tööde

ajendiks oli suuri vaidlusi tekitanud Vabadussõja mälestusmärgi rajamine bastioni alale, mille käigus tuvastatud erandlikke ehitusdetale (jn 4) soovisid monumendi oponendid kasutada argumendina projekti katkestamiseks. Arutelule kogunes Tallinna arheoloogiamälestiste ekspertnõukogu, kes leidis, et projekti teostamisel on arheoloogid sattunud ehitusprotsessi vildaka menetlemise töttu ebaõiglaselt surve alla ning loobus seadmast takistusi monumendi püstitamisele. Tööd jätkusid mai lõpus maataluse parkla rajamisel ette jäädvate kommunikatsioonitrasside teisaldamisega Vladimir Sokolovski (OÜ Tael) osalusel. Nende tööde olulisemateks tullemusteks oli varauusaegse Püha Barbara kalmistu kaevamine väljaku edelaküljel ning keskaegse Harju värava eesväravatorni avastamine väljaku loodenurgas. Väljaku enese arheoloogilised uuringud algasid juunis (OÜ AguEMS, Guido Toos, Villu Kadakas, Ragnar Nurk, Garel Püüa), mil esmalt dokumenteeriti varauusaegse kindlustusvööndi detaile. Just väljaku lõunaosa uurimine tõi enesega kaasa ootamatu põrde kavandatud välitööde programmi. Nimelt selgus, et lisaks kesk- ja uusaja ladestustele on piirkonnas hästi säilinud jälgvi kiviaja asustusest, mis sundis algsest kavandatud kaevamiste ajagraafikut oluliselt pikendama. Esialgu 2008 lõppema pidanud välitööd Vabaduse väljakul kestsid kuni 2009. a märtsikuuni.

Teise olulise päästetööobjektina tuleb nimetada Saaremaa Salmes leitud muinaslaeva jäänuseid, kus uuringute esimest etappi juhatasid Jüri Peets (AI) ja Külli Rikas (SM), teist Marge Konsa (TÜ). Rääkimata Eesti kontekstis ainulaadsed muinasasagsete laevaleiust, mille kohta lähemalt saab lugeda käesoleva kogumiku vastavas artiklis, tuleks esile tuua selle projekti interdisciplinaarsete uurimismeeskondu. Teisalt oli Salme laevaleid ka äärmiselt suures avalikkuse huviabiidis. Sellele vastamiseks tegid välitööde meeskonnaliikmed Internetti eraldi blogikeskkonna, milles jagati huvilistele teavet uurimistöö käigust ja uutest avastustest peaegu reaalajas. Positiivne vastukaja väljendub asjaolus, et blogikülastusi on Salme muinaslaeval olnud siiani üle 5000, näitab selgelt avalikkuse huvi ja ka vajadust kasutada välitööde jooksul erinevaid teavitamise-tutvustamise võimalusi.

Kahtlemata pälvisid suurtest päästekaevamistest enim tähelepanu Rünno Vissaku (MTÜ AEG) korraldatud väljakaevamised Tartu Ülikooli 2 ja 2A kruundil (jn 5), Peeter Piiritsa (MTÜ AEG) tööd Viljandi linnamüüri alal ja lähiümbruses ning 2008. aastal

lõppenud välitöödeprojekt Pärnus, mida tutvustavad järgnevatel lehekülgedel Rivo Bernotas, Aivar Kriiska ja Aldur Vunk (OÜ Arheograator ja PäMu).

Mõnest väiksemas mahus toimunud järelevalve-tööst saab lugeda vastavalt Gurly Vedru, Raili Allmäe ja Kadri Nigulase ning Villu Kadaka artiklitest (vastavalt Saha kabeliaja ja Paide kohta). Mainida võib veel Tallinnas toimunud järelevalveid Nunne ja Pika tänavaa hooneis (vastavalt OÜ Tael, Vladimir Sokolovski ja OÜ AguEMS, Ragnar Nurk ning Garel Püüa) ning Tallinna vanima eeslinna – Kalamaja (sk Vishermay) – kalmistu alal tehtud arheoloogilist seiret. Olulist uut informatsiooni andsid ka Uus tn 12 eeluuringud (OÜ AguEMS, Ragnar Nurk), kus dokumenteeriti keskaegse vallikraavi lõiku ning avastati uusaegse hoonestuse hästi säilinud vundamendid. Võttes arvesse, et umbes kolmveerand 2008. aastal toimunud välitöödest olid just arheoloogilised järelevalved, on käesolevas kogumikus esindatud siiski kahetsusväärselt väike osa vastavate tööde tulemustest.

Eestimaa muuseumidesse, Tartu Ülikooli arheoloogia kabinetti ja Tallinna Ülikooli Ajaloo Instituudi arheoloogiakogudesse võeti 2008. aastal arvele ühtekokku ligi kolmsada juhuleidu, millest vanimad pärinevad kivi- ja hilisemad uusajast. Sedavõrd ulatuslik juhuleidude laekumine oli kõigi aastate rekord, kuid ei anna põhjust röömustamiseks, sest enamasti oli tegemist metallidetektoritega

“ilusaid asju” jahtivate nn harrastusarheoloogide käest saadud esemekogumitega, mille kohta esitatud leiuandmetes oli mitmel puhul põhjust kahelda. Samas tuleb mainida, et üldises negatiivses valguses, kus arheoloogid peavad väga tihti kohtuma illegaalselt tegutsevate ja Eesti kultuuripärandi hoidmise suhtes pahatahtlike detektoristidega, väärivad esile tõstmist vähemasti mõned positiivsed näited meie ajaloo ja muististe suhtes hoolivat suhtumist üles näidanud isikutest. Nii näiteks edastas Urmas Kuusiku Põltsamaa muuseumile Rutikvere mõisast leitud hilisrauaegse – keskaegse ehtekomplekti, Priti Kumel aga Harjumaa muuseumile haruldasse pronksiaegse pronkskirve, Marvin Tammehoid Muinsuskaitseametile kolm pronksist ehet, sh rahvasterännuaja algusest pärit ambsõle ja viikingiaegse ehenteenõela (jn 6). Meedia tähelepanu pälvinud pronksist sõjanuianupu leil on plaanis peatuda põhjalikult 2009. aasta välitöid kajastavas väljaandes. Kõige tähelepanuvääärsem 2008. aasta juhuleid on aga kahtlemata Rein Rooduse Reiu jõe äärest Napsu külast avastatud 18. saj alguse hõbeaare (jn 7), mida eksponeeritakse kõigile huvilistele Pärnu muuseumis.

Avastatud uutest muististest ja suurematest maastikuinspektsioonidest annavad ülevaate Marje Konsa ja Mirja Otsa artikkel koos põhjaliku koondtabeliga.
